ACCESSION NR; AP4041353

band (zone) and elucidate the mechanism of electron scattering in these semiconductor compounds. The assumed band structure of GaAs is described. Extensive measurements were made of the thermo-emf of the compounds in order to investigate the structure of the allowed bands. Data and curves are given for the dependence of the effective electron mass on the carrier concentration in the crystal, the temperature dependence of the Hall constant, the temperature dependence of the height of the Fermi level, the temperature dependence of the relative resistivity increment ($\Delta\rho/\rho$) in a magnetic field, the Nernst-Ettinghausen effect, all for n-type GaAs; the dependence of the hole mass on the hole concentration in p-type GaAs; the temperature dependence of kinetic effects in InP; the temperature dependences of the Hall constant and $\Delta\rho/\rho$ and the field dependence of $\Delta\rho/\rho$ for n-type InAs. The mechanism of interaction of electrons with lattice vibrations in gallium arsenide and indium arsenide is discussed. Impurity effects are considered and various models are evaluated from the standpoint of their agreement with experiment and practical utility.

National Koranyi Institute for Tb (director: BOSZORMENYI, Miklos, Dr, scientific director: FOLDES, Istvan, Dr) (Orszagos Koranyi Tbc Intezet).

"Late Results of Resections Performed Because of Pulmonary Tuberculosis."

Budapest, Orvosi Hetilap, Vol 108, No 10, 5 Mar 67, pages 433-436.

Abstract: [Authors' Hungarian summary modified] 1) The late surgical results of 305 patients from Budapest have been examined who underwent surgery at the institute between 1955-57. The follow-up was successful insofar as it involved 96 per cent of the patients. 2) The condition of every patient was evaluated in detail including X-ray, bacteriological and functional studies. 3) At the time of the examination, 87 per cent of the patients were free of symptoms and complaints, 5 per cent were ill and 24 of them (8 per cent) had died. Of these, 11 died of some unrelated disease. 4) Of those who recovered, 249 (85 per cent of the cases) are employed. 5) The therapeutic results are dependent on the original condition of the patients, the X-ray morphological changes and the bacteriological findings. 6) Of prognostic importance from the aspect of late therapeutic results is the immediate postoperative course since favorable late results can be expected in only about 60 per cent of the cases which had severe complications while lasting success can be expected in about 90 per cent of the cases free of complications. 7) The conclusions reached by the analysis of the above patient material are applicable

Title : On Chemical and Bacteriological Indices in Sanitary
Inspection of Meat

Orig Pub : Rev. igiena, mecrobiol. si epidemiol., 1955, No 3, 78-87

Abstract : In conjunction with organoleptic determinations a study was made of some chemical and bacteriological indices of 100 samples of sound and tainted beef. It was found that values of pH, H_2S , PH_3 and amine nitrogen do not characterize individually the meat quality; Nessler's reaction ($NH_3 < 20$ mg%) and precipitation of globulins (Korezhnov's and corrosive sublimate methods) and also bacteriological investigation of the meat can serve as quality indices of meat. Considered is the correspondence of organoleptic, and chemico-bacteriological results of determinations.

SCHERZER, T.

Complex compounds of chromium with serin. J. Seifert and P. Spăcu (C. I. Parhan Univ., Bucharest, Romania). Z. anorg. u. allgem. Chem. 301, 107-214 (1959).—Addn. of excess Me₂CO to boiled aq. solns. of CrCl₃ and varying units of serin (AlII) ppts. viscous masses which, varying P₂O₅, at appropriate temps., give glassy, hygroscopic [Cr(AlII)(H₂O)Cl₄]·H₂O, [Cr(AlII)Cl₄]·2H₂O, [Cr(AlII)Cl₄]·Cl·3H₂O, [Cr(AlII)Cl₄]·3H₂O, and [Cr(AlII)Cl₄]·3H₂O. The compds. form viscous, acidic aq. solns. from which Cr(OH)₃ is not pptd. by NH₃. Cond. data are consistent with the above formulations; the ligand is monodentate, probably through the amine N. Addn. of 1 mol. NaOH to these complexes gives mononuclear complexes with bidentate ligands, i.e., [Cr(AlII)Cl₄] gives [CrA(AlII)·Cl₂] and [CrA₂(AlII)Cl] for 1 and 2 mols. NaOH, resp. Addn. of 3 mols. NaOH gives Cr(OH)₃ for the bis complex and the binuclear complex, [Cr₂A₂(OH)₂]·0.5H₂O (I) for the others; yields of the latter increase with increasing no. of AlII mols. in the initial complex but decrease if NaOH is added in excess of 3 mols. An inner complex, CrA₃, is not found. A mechanism for the condensation is suggested. The chelate rings of I are successively opened with appropriate units of concd. HCl to form [CrA(H₂O)Cl], [CrA(AlII)(H₂O)Cl₂], and [Cr(AlII)(H₂O)Cl₃]. Treatment of these compds. (or their aq. solns. obtained from I and HCl) with appropriate units of AlII gives [CrA(AlII)Cl₂]·H₂O, [Cr(AlII)Cl₃]·2H₂O, [CrA(AlII)₂]·Cl, [CrA(AlII)Cl]₂·Cl·H₂O, and [Cr(AlII)Cl₂]·Cl. The tris and tetrakis complexes resemble the mono complexes. Cond. and pH measurements show that in aq. soln. the Cr-AlII complexes undergo both acid dissociation and aquation with replacement of Cl⁻ or,

more slowly, AlII in the coordination sphere. Cond. and pH changes are used to evaluate the relative extent of these reactions in the different solns. Richard H. Jequith

TITLE: Automatic welder. Class 21, No. 179402 | 8

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 5, 1966, 48

TOPIC TAGS: welder, butt welding, seam welding | 4

ABSTRACT: This Author Certificate presents an automatic welder, using a nonmelting electrode in a protective atmosphere for ring and seam pipe welding. The welder includes an inlet port, ring-shaped rotator, welding head, system of roller supports, mechanisms for moving and correcting the welding head, electrode wire supplies, programmed current switching, and remote control equipment. To permit welding of variable diameter pipe and welding of flanges and rings, the rotator is equipped with a mechanism for displacement in the vertical plane, allowing a rotator body angle of 0--105° with respect to the horizontal. The centering mechanism consists of a fixture which is equipped with grips and shimming rings and a conical screw-driven compensator (see Fig. 1). A second feature has two perpendicular worms as

6. Analysis of forces in tube drawing. I. Introduction
R. H. L. L. [unclear]
J. M. [unclear]
1956, No. 1, 2, pp. 127-140.

In the course of tube experiments it was measured the forces arising during the drawing of relatively mild steel tubes with phosphatized surfaces. Electrical resistance strain gauges were used for the measurements. The drawing force remains constant during drawing. Only slight changes were caused in the drawing force by the different lubricants. According to comparative experiments the tubes with phosphatized surface can be drawn with the same effort as tubes with lime-coated surface. The force acting upon the mandrel stem was about 10 to 20% of the total drawing force. A comparison of several formulae used for calculating the forces arising in tube drawing proved that the best results could be obtained by the Geleji formula.

any

SOTHEY J.

1-45dc

Hot-working of aluminum. J. Schey (Tech. Univ. Miskolc). *Arch. Tech. Metall.* 16, 1st-2nd part (in German).--The hot-working phenomena of cast, extruded, and rolled (20-650°) 90.5% Al are reported. Rolling to 70% or extrusion at 41% reduction in area does not result in recrystn. In hot-worked specimens, recrystn. is found at subsequent heating, indicating previous work hardening. At increasing temp., resistance to deformation and hardening power decrease. Specimens worked above 400° and quenched in H₂O show const. hardness. The observations confirm that hot-working is not a simple sequence of work-hardening and recovery. [Signature]

✓ 84. Examination of forces arising in the course of tube drawing. R. Hunatos, J. Heeringer, I. Schev.
A Magyar Tudományos Akadémia Műszaki Tudományok
Osztályának Közleményei. Vol. 21, 1957, No. 1—4, pp.
141—155, 12 figs., 5 tabs.

The forces arising in the course of drawing phosphate-coated mild steel tubes over a mandrel have been measured in full-scale tests. Measurements were conducted by using extensometers of the electric resistance type. The force of drawing remained constant during the drawing operations and was only slightly altered by various kinds of lubricant. Comparative tests proved that phosphate-coated pipes could be drawn with the same force as lime-coated ones. The force acting on the stem of the mandrel is 10—20% of the total force of drawing. Some of the formulae used for computing the forces occurring in the drawing of tubes were compared to the results of measurement. Geleji's formula was found to yield the best results.

The value of radiological examination for the evaluation of certain morphological and functional modifications of the heart in marathon runners. STUD. CERC. FIZIOL. 1956, 1/1-2 (91-97)

Eleven marathon athletes were examined: orthodiagram of the heart and of the

1975

CONT.

aorta, orthodiagraphic registration of the movements of the diaphragm, radiokymography of the heart, systolic and diastolic volume, systolic output, and contractility index. The findings led to the following classification: during the resting period: first group 1 case, second group 6 cases, third group 4 cases; during training: first group 1 case, second group 8 cases, third group 2 cases; immediately after the run: first group 3 cases, second group 6 cases, third group 2 cases. The results obtained are discussed, and the following conclusions are arrived at: classification of the hearts of athletes must be done for every period separately; there is agreement between the performance shown and the morphological and functional aspects of the heart; hypertrophy of the myocardium is preceded by tonogenous dilatation, hence the decrease of the dimensions of the heart after the run; the findings are of practical importance because they supply valuable information for the direction of the training: for instance, the passage from group 3 to group 2 is the result of correct training, whereas passage from group 2 to group 3 indicates overtraining.

893. RADIOLOGICAL ASPECT OF THE AFFERENT LOOP SYNDROME - Aspectul radiologic al sindromului de ansă aferentă - Schiau S., Debău M. and Stoeneescu R. - PROBL. TERAPEUT. 1957, 5 (27-32)

After a brief description of the clinical picture, the radiological appearance of the afferent loop syndrome is described. This syndrome should not be confused with stasis in the afferent loop or even with filling of a long stretch of the loop with barium. The most frequent causes of barium filling of the afferent loop are: an-isoperistaltic anastomosis, changes of the anastomosis opening, sloping position of the afferent loop, reduction of the calibre of the afferent loop etc. A description is given of the radiological appearance of the afferent loop (rhythm of filling, diluted contents of the loop, changes of its contours), the other signs accompanying the syndrome, and the most constant sign, which is described and termed 'sign of palpation of the loop'. The conclusions to be drawn from this study are presented. (XIV, 9*)

804. JUXTACARDIAL GASTRIC DIVERTICULA - Diverticuli gastrici juxta-
cardiali - Stoeneescu R. and Schiau S. - MED. INTERN. (Bucuresti)
1957, 9/7 (1060-1068) ILLUS. 8

The presence of juxtacardial gastric diverticula, a rare disease, is mostly dia-
gnosed radiologically. The symptoms, if any, are due to complications. Con-
siderations on 5 cases encountered among 6,000 radiological examinations are
presented. The radiological diagnosis depends on the accuracy with which the
examination is carried out (different positions and incidences). A thin-layer
examination should be performed first. The radiological picture consists of a well-
marked round or oval spot with regular margins, outside the gastric outline. In
differential diagnosis, posterior recessus of the fornix and pseudodiverticula
should be eliminated. Medical treatment gives satisfactory results.

389. RADIOLOGICAL CONTRIBUTIONS TO THE STUDY OF THE PHYSIOPATHOLOGY OF HIATUS HERNIAS - Contribuții radiologice la studiul fiziotopologică a herniilor hiatale - Schiau S., Stoenescu R., Deba M. and Dumitriu L. - STUD. CERCET. FIZIOL. 1958, 3/2 (143-154) Illus. 4

The problem is exposed and the results of personal studies are presented. It is believed that there exists a pure cardio-hiatal insufficiency which is only the precursor of hiatus hernia. The radiological sign of this insufficiency is oesophageal reflux. If the cardio-hiatal insufficiency exerts its action on the oesophagus or on the

Hiatal ring, the result is one of Åkerlund's 3 types of hernias, with the possibility of transformation from one type into another. The most important difference between the types lies in the length and position of the lower oesophagus: it is shorter than normal in type I, normal in type II and longer than normal in type III. Of 68 cases of hiatus hernia, there were 6 with type I, 9 with type II and 53 with type III. The hernias were reducible in 36 and non-reducible in 32 cases. Twelve hernias were asymptomatic; 10% were associated with hypochromic anaemia and 50% with other affections. In 85% of the cases there were local disturbances, in 65%, insufficiency of the cardia, and in 60%, oesophageal affection.

THE RADIOLOGIC DIAGNOSIS OF FISTULAE BETWEEN THE DUODENUM AND THE COMMON BILE DUCT, SECONDARY TO DUODENAL ULCER - Diagnosticul radiologic al fistulelor duodeno-coledociene secundare ulcerului duodenal - Schiau S., Rațiu O., Popescu M. and Stoeneșcu R. - MED. INTERNA (București) 1958, 10/1 (113-116) Illus. 2

A report is given of 3 cases in which the diagnosis of ulcer penetrating into the common bile duct, with secondary bilidigestive fistula, was made on the basis of the radiological findings and confirmed at operation. Mention is made of the technique of radiological exploration and of the factors which may give rise to confusion.
